(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltages are with respect to network ground terminal.

(3) This IC includes over temperature protection that is intended to protect the device during momentary overload. Junction temperature will exceed 125°C when over temperature protection is active. Continuous operation above the specified maximum operating junction temperature may impair device reliability.

(4) ESD testing is performed according to the respective JESD22/JEDEC standard. The human body model is a 100pF capacitor discharged through a 1.5kΩ resistor into each pin. The machine model is a 200pF capacitor discharged directly into each pin.

### **C<sub>OUT</sub>** Auto-Discharge Function

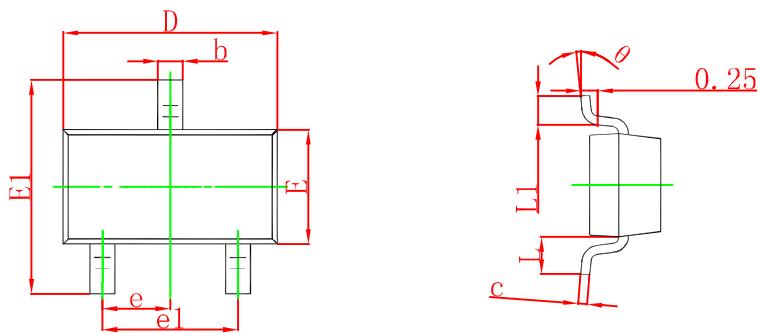

ZS6211 series can discharge the electric charge in the output capacitor (C<sub>OUT</sub>), when a low signal to the CE pin, which enables a whole IC circuit turn off, is inputted via the N- channel transistor located between the V<sub>OUT</sub> pin and the V<sub>SS</sub> pin (cf. BLOCK DIAGRAM). The C<sub>OUT</sub> auto-discharge resistance value is set at 60Ω(V<sub>OUT</sub>=3.0V @ V<sub>IN</sub>=5.0V at typical). The discharge time of the output capacitor (C<sub>OUT</sub>) is set by the C<sub>OUT</sub> auto- discharge resistance (R) and the output capacitor (C<sub>OUT</sub>). By setting time constant of a C<sub>OUT</sub> auto-discharge resistance value [R<sub>DISCHRG</sub>] and an output capacitor value (C<sub>OUT</sub>) as  $\tau(\tau=C \times R_{DISCHRG})$ , the output voltage after discharge via the N-channel transistor is calculated by the following formulas.

$$V = V_{OUT(E)} \times e^{-t/\tau} \text{ or } t = \tau \ln(V/V_{OUT(E)})$$

( V : Output voltage after discharge, V<sub>OUT(E)</sub> : Output voltage, t: Discharge time,

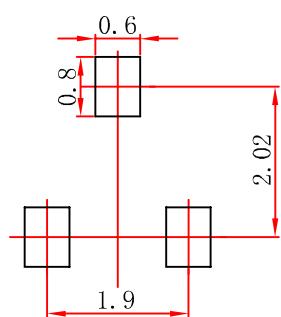

$\tau$ : C<sub>OUT</sub> auto-discharge resistance R<sub>DISCHRG</sub>×Output capacitor (C<sub>OUT</sub>) value C )
